

# INSTALLATION INSTRUCTIONS

- 1 Check that each panel is free of flaws before installation. An installed product indicates approval.
- 2 Open the packages in the space in which they are to be installed 3–4 days prior to installation, and allow the moisture levels to stabilise.
- 3 If necessary, install the studding strips, 600 mm apart for walls and 400 mm for ceilings.
- 4 Centre the panels so that the first and last panel are approximately the same width.
- 5 The panels can be installed horizontally or vertically. You can choose your own configuration.
- 6 Panels are installed from the bottom upwards, tongue first. For best end results use an air stapler with staples of approximately 20–25 mm in length.
- 7 Adjust the compressor pressure so that the top does not sink too far into the panel, but does not stick out either.
- 8 The staple should hit the tongue, ensure that the top is covered by the next panel. In ceiling installation use two staples/studding strips.
- 9 Any heavy objects should be hung from screws that are long enough to pass through the panelling into the studding.
- 10 Finish the installation with Laatu-paneeli decorative moulding.
